PRINTED GLASS PRODUCTS

WHAT IS UV PRINTING?

UV printing is a unique, patented technology which allows high quality, direct-to-media printing on literally any surface.

UV printing is different to conventional printing because of the way that the ink dries. Instead of having solvents in the ink that evaporate into the air and absorb into the paper, UV inks harden through a photomechanical process, which makes them much more durable, richer in colour and most importantly applicable to any surface.

UV inks do not actually dry, as there is nothing in them to dry. Instead they cure. Although they appear to be liquid, like solvent-based inks, they are actually solids that are suspended in liquid during application. After which they are exposed to ultraviolet light, at which point they cure instantly. This means no waiting for prints to dry, no storage racks to hold drying substrate, and no bulky heat-drying equipment.

Another benefit of this application process is that when using the solid UV ink 100% of the ink remains on the substrate. With solvent-based inks, the ink deposit will shrink during the drying process until only the pigments and resins remain, leading to a less durable and less precise finish.

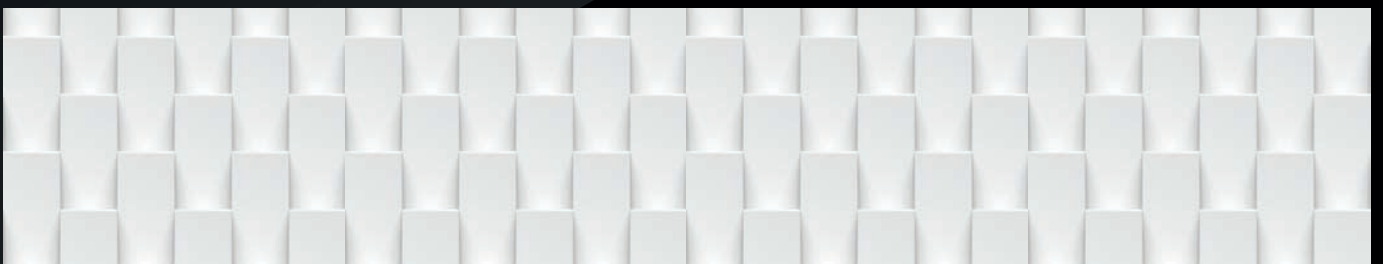

ANY COLOUR. ANY IMAGE. ANY SURFACE.

- Printing is possible on almost any rigid material, up to a thickness up to 100mm.
- We can print any image provided by the customer, as well as colour-matching with existing materials.
- We can print an area of 1.35 x 2.96m area in one solid piece. Larger sizes are available on flexible materials or by feeding materials through the printer. Minor joints possible on larger pieces.
- UV ink is water resistant, sun resistant, weather resistant and wear resistant, making it perfect for glass printing, exterior displays, bespoke interiors, architectural applications and much more.
- Our equipment enables us to adjust all colours and settings to the exact specifications or colour match samples.
